

Assignment 2

Grigorev Mikhail, J4133c

Part A

Equation 1

$$x \frac{dx}{dt} = 1 - t$$

Separatable first-order linear ODE:

$$\begin{aligned} x dx &= (1 - t) dt \\ \int x dx &= \int (1 - t) dt \\ \frac{x^2}{2} &= t - \frac{t^2}{2} + C_0 \\ x^2 &= 2t - t^2 + C_1 \\ x &= \pm \sqrt{2t - t^2 + C_1} \end{aligned}$$

Answer:

$$x = \pm \sqrt{2t - t^2 + C}$$

Equation 2

$$y' - y = 2x - 3$$

Inseparable non-homogeneous first-order linear ODE. Let's solve a homogeneous ODE:

$$\begin{aligned} y' - y &= 0 \\ \frac{dy}{dx} &= y \\ \frac{dy}{y} &= dx \\ \int \frac{dy}{y} &= \int dx \\ \ln y &= x + C_0 \\ y &= C_0 e^x \end{aligned}$$

Go back to the initial ODE with $y = \varphi(x)e^x$:

$$\begin{aligned} \left(\varphi(x)e^x \right)' - \varphi(x)e^x &= 2x - 3 \\ \varphi'(x)e^x + \varphi(x)e^x - \varphi(x)e^x &= 2x - 3 \\ \varphi'(x)e^x &= 2x - 3 \\ \varphi'(x) &= (2x - 3)e^{-x} \\ \varphi(x) &= \int (2x - 3)e^{-x} dx \end{aligned}$$

Let's compute the latter integral:

$$\begin{aligned}
 u &= (2x - 3) & du &= 2dx \\
 dv &= e^{-x} & v &= -e^{-x} \\
 \int u dv &\equiv uv - \int v du \\
 \int (2x - 3)e^{-x} dx &= (3 - 2x)e^{-x} + 2 \int e^{-x} dx = (3 - 2x)e^{-x} - 2e^{-x} + C_0
 \end{aligned}$$

So, φ :

$$\begin{aligned}
 \varphi(x) &= (3 - 2x)e^{-x} - 2e^{-x} + C_0 \\
 y &= \varphi(x)e^x = (3 - 2x) - 2 + C_0e^x \\
 y &= C_0e^x - 2x + 1
 \end{aligned}$$

Answer:

$$y = Ce^x - 2x + 1$$

Equation 3

$$y^2 + x^2 y' = xy y'$$

Inseparable non-homogeneous first-order linear ODE. Let's brush it up:

$$\begin{aligned}
 \left(\frac{y}{x}\right)^2 + y' &= \frac{y}{x} y' \\
 t = \frac{y}{x} & \quad y = tx & y' &= t'x + t \\
 t^2 + t'x + t &= t(t'x + t) \\
 t^2 + t'x + t &= t'tx + t^2 \\
 t'x + t &= t'tx \\
 \frac{dt}{dx} x(t - 1) &= t \\
 \frac{dt}{t} x(t - 1) &= \frac{dx}{x} \\
 \int \frac{dt}{t} (t - 1) &= \int \frac{dx}{x} \\
 \int \left(1 - \frac{1}{t}\right) dt &= \ln x \\
 t - \ln t &= \ln x + C
 \end{aligned}$$

This cannot be simplified, this is the solution. Let's use x and y .

$$\frac{y}{x} - \ln \frac{y}{x} = \ln x + C$$

Potential solution is $x = 0$. Let's check:

$$y^2 = 0$$

Generally, no. Answer:

$$\frac{y}{x} - \ln \frac{y}{x} = \ln x + C$$

Equation 4

$$(2 - 9xy^2)xdx + (4y^2 - 6x^3)ydy = 0$$

Let's check if this is an ODE in full differentials:

$$\underbrace{(2x - 9x^2y^2)}_{F'_x}dx + \underbrace{(4y^3 - 6x^3y)}_{F'_y}dy = 0$$

$$F'_{xy} = -18x^2y$$

$$F'_{yx} = -18x^2y$$

ODE in full differentials:

$$F'_x = (2x - 9x^2y^2)$$

$$F(x, y) = \int 2x dx - 9 \int x^2 y^2 dx$$

$$F(x, y) = x^2 - 3x^3y^2 + \varphi(y)$$

$$F'_y = (4y^3 - 6x^3y) \quad (*)$$

$$F'_y = \left(x^2 - 3x^3y^2 + \varphi(y) \right)'_y$$

$$F'_y = -6x^3y + \varphi'_y(y) \quad (**)$$

$$(*), (**) \implies 4y^3 - 6x^3y = -6x^3y + \varphi'_y(y)$$

$$\varphi'_y(y) = 4y^3$$

$$\varphi(y) = y^4 + C_0$$

All in all:

$$F(x, y) = x^2 - 3x^3y^2 + y^4 + C_0$$

Answer:

$$x^2 - 3x^3y^2 + y^4 = C$$

Equation 5

$$(2x + 1)y' = 4x + 2y$$

$$y' - \frac{2}{2x + 1}y = \frac{4x}{2x + 1}$$

Inseparable non-homogeneous first-order linear ODE. Let's solve a homogeneous ODE:

$$y' - \frac{2}{2x + 1}y = 0$$

$$\frac{dy}{dx} = \frac{2}{2x + 1}y$$

$$\frac{dy}{y} = \frac{2dx}{2x + 1}$$

$$\ln y = \ln(2x + 1) + C_0$$

$$y = C_1(2x + 1)$$

Go back to the initial ODE with $y = \varphi(x)(2x + 1)$:

$$\begin{aligned}(2x + 1) \left(\varphi(x)(2x + 1) \right)' &= 4x + 2\varphi(x)(2x + 1) \\ (2x + 1) \left(\varphi'(x)(2x + 1) + 2\varphi(x) \right) &= 4x + 2\varphi(x)(2x + 1) \\ \varphi'(x)(2x + 1)^2 &= 4x \\ \varphi'(x) &= \frac{4x}{(2x + 1)^2} \\ \varphi(x) &= 4 \int \frac{x}{(2x + 1)^2} dx\end{aligned}$$

Let's compute the integral:

$$\begin{aligned}\int \frac{x}{(2x + 1)^2} dx &= \int \left(\frac{1}{2(2x + 1)} - \frac{1}{2(2x + 1)^2} \right) dx = \\ &= \int \frac{1}{2(2x + 1)} dx - \int \frac{1}{2(2x + 1)^2} dx = \\ &= \frac{1}{4} \ln(2x + 1) + \frac{1}{4(2x + 1)} + C_2\end{aligned}$$

Get back:

$$\varphi(x) = \ln(2x + 1) + \frac{1}{(2x + 1)} + C_3$$

Get back once more:

$$y = \varphi(x)(2x + 1) = (2x + 1) \ln(2x + 1) + 1 + C_4$$

Potential solution is $x = -0.5$. Let's check:

$$\begin{aligned}0y' &= -2 + 2y \\ y &= 1\end{aligned}$$

Not necessarily. Answer:

$$y = (2x + 1) \ln(2x + 1) + 1 + C$$

Part B

Task 1

Task 2
